

The world is reticent. Sea, in our vision, is a field of undulating fluid, repetitively riding the rhythm of the tide day-long and day-after. Desert is a plain of migrating sand, restlessly driving the pace of the wind eastwards and west. Water is silent, so are the pebbles lying on the riverbed, rocks resting on the plateau, bones left behind the flesh. They never speak up in our language, nor compete for our attention. Or it's better to say that we receive each other so naturally that the resonance we share remains inconspicuous. Yet they--as we find them--become pigments, surfaces, tools to paint and draw with.

Well, may I say: they're good as they are found. They are beautiful and perfect in the way they are made by this world. Why should we disturb them at all?

But if so, how can we know them? We are in this world. Do we know them by leaving them as they are? How can we know something as a rock if we don't handle it in its toughness? How can we know the endurance of the wood without carving or sawing it? How can we know if we don't observe? If we don't delineate? If we never make something with it, according to it, upon it?

We do. So the world speaks to us.
